

15 – Debugging

How to debug your code?

Jérôme Landré – jerome.landre@ju.se

OUTLINE

på svenska

OUTLINE

In English

OUTLINE

- 1) Bug
- 2) Read the error messages!
- 3) Your best friend: `console.log()`
- 4) Last Solution

1) BUG

- As web developers, you want to avoid your enemy, the:

1) BUG

- In programming, sometimes they are not:

1) BUG

- It is the same in programming:
 - To make a program run, you need:
 - Syntactically correct: the code is well-written
 - Semantically correct: the meaning is good, the behavior is the one you want
 - In Javascript, the code is **non-blocking**!
 - It means the code will not execute synchronously but asynchronously
 - JS is an event-based language
 - It makes JS very difficult to debug!

2) READ THE ERROR MESSAGES!

- When you have a function that provides errors, display the error and read it!
- The error message gives the error type and the line where it occurs
- 80% of the time, you have just forgotten a closing) or }
- 20% of the time, you need to investigate more...

3) YOUR BEST FRIEND: `console.log()`

- When you face an error in one of your routes, try to **`console.log()`** a message to see if your code is going through this route
- You can log a **string** message (character string):

```
console.log('This is the good route!...')
```
- You can log the **content** of a variable

```
console.log('The error is: '+error)
```
- If the content of the variable says 'object', then try:

```
console.log('My variable contains: '+JSON.stringify(myVariable))
```

(of course, you need to change the name of the variable "myVariable")

3) LAST SOLUTION

- Please, come to the labs and

ASK for HELP!

ANY QUESTIONS?
