

Lab 1: HTML, CSS

The first lab session is dedicated to HTML and CSS. You will create your Curriculum Vitae (CV) as HTML and CSS files. You need to create two versions of your CV with the same content but are presented differently. To begin with, create a directory “TGWK12-lab1” somewhere on your computer. It will be the working directory for lab 1.

1) Your CV without CSS

In your “TGWK12-lab1” directory, create a “mycv-01.html” empty file using Visual Studio Code. In this file, create your HTML code with the information of your CV. It is a **ONE PAGE** site. Add your photo to your html file using a directory “img/”, a subdirectory of “TGWK12-lab1”.

This file **MUST** contain the following elements:

- Information: A photo of you (an image “”), your first name, last name, e-mail, and phone number (please put 07 07 07 07 07 as your phone number!)
- Education: A list of your studies and diploma (including this year) sorted by date (descending), at least 2
- Work: A list of works/jobs you have made, at least 2. If you don’t have any work experience, no problem, invent an imaginary job you could have done: babysitting, ice cream shop, ...
- Computer skills: A “list”, presented as you wish of your computer skills and knowledge, at least 5 skills
- Languages: your written and spoken language skills presented the way you want
- Others: your hobbies, your driving license, ...

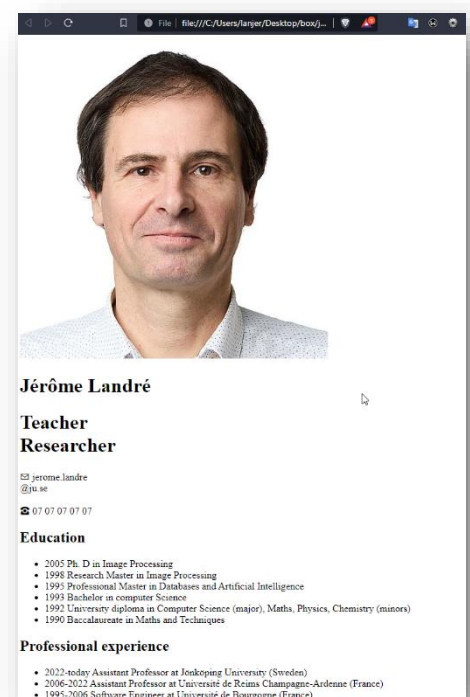

The purpose of this first exercise is to make you work on the **structure** of your page.

You **MUST** use HTML semantic tags: h1, h2, h3, div, header, img, ul, li. Your code must be indented and commented on properly.

An example of an HTML CV without CSS is given in figure 1. It is just an example, of course, you won’t get the same result because you will create YOUR CV, not mine.

This first **unique** file **MUST** be named “mycv-01.html”.

Figure 1: CV with no CSS.

2) Your CV with CSS

In this exercise, you must use your previous “mycv-01.html” file, make a copy, and name this copy “mycv-02.html”. You will now add styles to your first version.

In this file, you **MUST** use a link tag to specify an external style sheet to apply to the content of your file. The css filename must be “cv02.css”.

You **MUST** use a “sans-serif” font for your CV. You can, if you want, use one or more “Google font(s)” in your CSS. In this version, you can use CSS with/without flexbox and/or grid but **no CSS Framework**.

You can use images, colors, backgrounds, and gradients: **Be creative!**

An example of my CV after applying the style is given in figure 2.

You should now have three files only in your directory: “mycv-01.html”, “mycv-02.html” and your stylesheet file “cv02.css”.

Figure 2: CV with CSS.
